

Senior BI Database Analyst

Responsibilities:

1 - Execute specific RSI Project requirements in relation to data exports and imports from the existing data warehouse into the new Online Analytics Platform. Specifically, the Senior BI Database Analyst must;

Understand the CLIENT's existing data warehouse design and processes;

Create any data transformations and logging for data extracts from the existing data warehouse;

Develop databases and tables to support extracts and data imports;

Create data feeds and integration with separate application under construction;

Assist with role-based access control and token-based authentication setup;

Consult on data versioning techniques; and

Train existing CLIENT staff on design and code created.

2 - Throughout the process the Senior BI Database Analyst needs to work alongside the CLIENT Business Intelligence department's database analysts on the design and implementation of any code into the existing platform and ensure they are familiar with what has been constructed. Requirements have been gathered and documented for data exports and imports from the assessment rate setting model application.

3 - The Senior BI Database Analyst must possess the following:

Minimum of five (5) years of demonstrated related experience as a Business Intelligence DBA or Business Intelligence Database Analyst in a data-driven organization;

Working knowledge with Microsoft Power BI;

Extensive Knowledgeable in Microsoft SQL Server with experience in database design;

Knowledge of SQL Server Integration Services (SSIS); and

Knowledge of SQL Server Reporting Services (SSRS).

4 - The Senior BI Database Analyst should possess the following:

Knowledge of role-based access control and token-based authentication in a Microsoft environment;

Knowledge of Team Foundation Services (TFS) and agile software release practices; and

Ability to perform work according to CLIENT source code management, release management and incident management.

5 - The following attributes held by the Senior BI Database Analyst may be considered an asset:

Knowledge of role-based access control and token-based authentication in an IBM WebSphere environment;

Knowledge and experience of the insurance models;

Knowledge of actuarial practices and principles;
